

GREEN RIBBON™ Solar Powered Homes:

- Designed from the ground up to use only as much energy as it produces
- The **Green Ribbon™ Home** is an **Energy Star™** rated house that is built at the **Hallmark SW Corporation** factory in Loma Linda to **Green Ribbon™ Home** standards
- Designed to make use of Federal and State Utility mandates known as “Net Metering”.

Net Metering requires the utility company to allow homes that are connected to the power grid to receive credit for the unused energy they produce from roof top solar power or other renewable power applications.

With net metering, the electric power produced by the **Green Ribbon™ Home** while the sun is shining during the day, can be returned to the grid and literally “spin the utility meter backwards”.

At night, when the sun is no longer shining, the occupants turn on their lights and appliances, which will then draw power back from the utility company against the credit their solar power system produced for them during the day time.

Because of the many energy efficient features built into the **Green Ribbon™ Home**, the use of power during the night can strike a balance against the credit produced from unused electric generation during the day. This point balance results in a “net” difference of zero dollars owed on the utility bill, a “net zero energy” bill.

The **Green Ribbon™ Home** is designed with special features that assure the occupants complete comfort day and night and during periods of inclement weather.

Indoor climate control will normally be accomplished with the home's proprietary **Silent Aire Night Ventilation System™**, solar thermal space heating, and solar electric generating systems, but the **Green Ribbon™ Home** can be automatically switched to complete grid power to provide any additional heating or cooling as desired by the occupants.

REBATES!

The **Green Ribbon™ Home** comes with solar thermal collectors to convert the power of the sun into domestic hot water and space heating.

QUICK PAYBACK!

REBATES!

The **Green Ribbon™ Home** uses solar electric power from its rooftop to provide household electric current for all the home's appliances and lighting.
